The continuous advances in our understanding of hematology and neo plastic disorders have made possible this third volume of reviews. Their purpose is to summarize investigations which have defined new concepts, and, it is hoped, stimulate new ideas. In the choice of subjects, we have attempted to retain the balance between academic and clinical interests. We are grateful to the contributors, who have maintained the high standards set in the earlier volumes, and for feedback from readers. Both have helped to orient the direction of this series. It was a reader who pointed out that the title of the two earlier volumes, *The Year in Hematology*, was misleading since it suggested a detailed review of trends and findings limited to the last year. In response to this valid comment, *The Year . . .* has been changed to *Contemporary . . .* and the scope has been expanded to encompass the kindred disciplines of hematology and oncology. Another editor, Franco M. Muggia, has been added to provide additional expertise for the latter field. The title of the present and future volumes has been changed to *Contemporary Hematology/Oncology*. It has been pointed out to us that considerable ingenuity will be needed to find topics not already covered. We believe that the papers in the present volume have met this challenge. As before, the readers' comments concerning *Contemporary Hematology/Oncology* will be appreciated. Joseph LoBue Albert S. Gordon Robert Silber Franco M. This book is a centennial volume celebrating the enormous progress made in hematology in the 20th century. It is edited by Marshall Lichtman, a distinguished senior hematologist, past president of the American Society of Hematology, and co-editor of the leading text in the field. Hematology is a compendium, with commentaries, of the most important papers published in the field from 1900-1999. The book will be useful for reference--many of the older papers can no longer be found in most libraries, yet are still referred to in current publications, especially review articles--as well as teaching. The Editor and a team of associate editors have included the most important papers covering eight categories: anemia; phagocytic cells; platelets; coagulation and thrombosis; lymphocytes and immune disorders; transfusion medicine; hematologic malignancies and therapeutics; and laboratory developments. Each paper is accompanied by a 1-2 page commentary explaining its impact, and references to the developments that resulted. Key Features * Contains 86 landmark articles from the last 100 years of research in clinical hematology * Includes expert commentaries discussing the impact of each article * Cites approximately 1000 preceding or subsequent articles of consequence in the commentaries * Includes the English translations of nine articles originally published in other languages * Provides easy access to several papers that may no longer be found in libraries *Frontiers in Clinical Drug Research - Hematology* is a book series that brings updated reviews to readers interested in learning about advances in the development of pharmaceutical agents for the treatment of hematological disorders. The scope of the book series covers a range of topics including the medicinal chemistry, pharmacology, molecular biology and biochemistry of natural and synthetic drugs employed in the treatment of anemias, coagulopathies, vascular diseases and hematological malignancies. Reviews in this series also include research on specific antibody targets, therapeutic methods, genetic hemoglobinopathies and pre-clinical / clinical findings on novel pharmaceutical agents. *Frontiers in Clinical Drug Research - Hematology* is a valuable resource for pharmaceutical scientists and postgraduate students seeking updated and critically important information for developing clinical trials and devising research plans in the field of hematology, oncology and vascular pharmacology. The fourth volume of this series features 5 reviews: -TRP Channels: Potential Therapeutic Targets in Blood Disorders -Hypercoagulable States: Clinical Symptoms, Laboratory Markers and Management -Advanced Applications of Gene Therapy in the Treatment of Hematologic Disorders -Ferroptosis - Importance and Potential Effects in Hematological Malignancies -Clinical Application of Liquid Biopsy in Solid Tumor HCC: Prognostic, Diagnostic and Therapy Monitoring Tool. The world's most highly regarded reference text on the mechanisms and clinical management of blood diseases A Doody's Core Title for 2019! Edition after edition, Williams Hematology has guided generations of clinicians, biomedical researchers, and trainees in many disciplines through the origins, pathophysiological mechanisms, and management of benign and malignant disorders of blood cells and coagulation proteins. It is acknowledged worldwide as the leading hematology resource, with editors who are internationally regarded for their research and clinical achievements and authors who are luminaries in their fields. The Ninth Edition of Williams Hematology is extensively revised to reflect the latest advancements in basic science, translational pathophysiology, and clinical practice. In addition to completely new chapters, it features a full-color presentation that includes 700 photographs, 300 of which are new to this edition, and 475 illustrations. Recognizing that blood and marrow cell morphology is at the heart of diagnostic hematology, informative color images of the relevant disease topics are conveniently integrated into each chapter, allowing easy access to illustrations of cell morphology important to diagnosis. Comprehensive in its depth and breath, this go-to textbook begins with the evaluation of the patient and progresses to the molecular and cellular underpinnings of normal and pathological hematology. Subsequent sections present disorders of the erythrocyte, granulocytes and monocytes, lymphocytes and plasma cells, malignant myeloid and lymphoid diseases, hemostasis and thrombosis, and transfusion medicine. This book is the updated English version of the 2006 German bestseller *Zellulare Diagnostik*, a comprehensive presentation of flow cytometry and its applications. While some techniques of immunophenotyping by flow cytometry already are routine procedures in the laboratory, new methods for the functional characterization of cells, the analysis of rare cells, and the diagnosis of complex materials have only begun to win wide recognition. New approaches such as slide-based cytometry will lead to an increase in the use of cytometric

techniques. Multiparameter approaches will further improve analysis. The book provides a comprehensive and detailed compilation of all aspects of flow cytometry in research and the clinic. For newcomers it offers a thorough introduction, for advanced users, specific protocols and interpretation assistance. Since the original publication of *Allogeneic Stem Cell Transplantation: Clinical Research and Practice*, Allogeneic hematopoietic stem cell transplantation (HSC) has undergone several fast-paced changes. In this second edition, the editors have focused on topics relevant to evolving knowledge in the field in order to better guide clinicians in decision-making and management of their patients, as well as help lead laboratory investigators in new directions emanating from clinical observations. Some of the most respected clinicians and scientists in this discipline have responded to the recent advances in the field by providing state-of-the-art discussions addressing these topics in the second edition. The text covers the scope of human genomic variation, the methods of HLA typing and interpretation of high-resolution HLA results. Comprehensive and up-to-date, *Allogeneic Stem Cell Transplantation: Clinical Research and Practice, Second Edition* offers concise advice on today's best clinical practice and will be of significant benefit to all clinicians and researchers in allogeneic HSC transplantation. This volume provides a comprehensive and world-class review of the field of histiocytic neoplasms and hemophagocytic lymphohistiocytosis (HLH). It reviews all the advances in the field of histiocytoses during the last ten years, particularly with regards to the genomic findings in LCH and other histiocytic neoplasms and the new suggested classification of the histiocytoses disorders. Additionally, it features a state-of-the-art update on the most recent treatment strategies for LCH, including the results of the last LCH-III international trial, salvage therapies such as reduced-intensity conditioning (RIC) stem cell transplant (SCT), and targeted therapies with BRAF and MEK inhibitors, as well as the challenging cases of CNS-neurodegenerative LCH and its therapeutic perspectives. For primary and secondary HLH the book updates the most recent genetic and pathophysiological findings, including macrophage-activation syndrome (MAS), and includes a special chapter on HLH in adults. Treatment chapters encompass therapy for newly diagnosed HLH and refractory disease as well as stem-cell transplantation and novel therapies. The text also highlights the most recent advances in the treatment of the uncommon histiocytic disorders, such as Erdheim-Chester disease (ECD), Juvenile xanthogranuloma (JXG) and JXG-like conditions, Rosai-Dorfman disease (RDD), and the very rare malignant histiocytoses. Written by international experts in the field, *Histiocytic Disorders* is a valuable resource for clinicians, researchers, fellows and residents who are interested in or manage histiocytic disorders in children and adults. NOTE: This loose-leaf, three-hole punched version of the textbook gives you the flexibility to take only what you need to class and add your own notes - all at an affordable price. For loose-leaf editions that include MyLab(tm) or Mastering(tm), several versions may exist for each title and registrations are not transferable. You may need a Course ID, provided by your instructor, to register for and use MyLab or Mastering products. For courses in hematology and coagulation. Comprehensive survey of laboratory hematology, for both MLT and MLS students *Clinical Laboratory Hematology* balances theory and practical applications in a way that is engaging and useful to medical laboratory technician and science (MLT/MLS) students, at all levels. Detailed technical information combined with a running, realistic case study provide ample opportunities to analyze and synthesize information, answer questions and solve problems, and consider real-world applications. The 4th edition has been thoroughly updated with the latest advances in laboratory medicine and with updated content on iron metabolism and myelodysplastic syndromes. *Clinical Laboratory Hematology, 4th Edition*, is also available via Revel(tm), an interactive learning environment that enables students to read, practice, and study in one continuous experience. Assembles a world-class group of neonatologists, representing the true leaders of the specialty, to ensure the most authoritative content available. Haematology is a rapidly changing subject, and it is therefore difficult for students to attain the level of knowledge required to get the most from their studies and to interpret scientific papers. This text is intended to bridge the gap between what students know and "cutting edge" advances. This volume allows the reader to learn from original slides, it features all haematologic diseases as they appear to the examiner. Now in its second edition, Modern Hematology: Biology and Clinical Management reflects the major advances in the understanding, diagnosis, and treatment of blood disorders. It describes the latest clinical and scientific developments as well as details targeted and molecular therapies. The book brings together facts, concepts, and protocols important for the practice of hematology. In 23 chapters, all major blood diseases are covered, as well as rare diseases that are of scientific interest. As in the previous edition, each chapter is illustrated by tables, figures, and a selection of color plates. This book, written by respected experts, discusses in detail the latest developments in targeted therapy for hematologic malignancies using small molecules. It covers a wide range of small molecules including tyrosine kinase inhibitors, immunomodulatory drugs, the IDH-2 inhibitor enasidenib, the BCL-2 inhibitor venetoclax, and the proteasome inhibitor carfilzomib. For each molecule, aspects such as the chemical structure, mechanism of action, drug targets, drug interactions, preclinical studies, clinical trials, treatment applications, and toxicity are discussed. Extensive research into the molecular mechanisms of cancer has heralded a new age of targeted therapy. The field of precision cancer therapy is now growing rapidly, and the advances being made will mean significant changes in the treatment algorithms for cancer patients. Numerous novel targets that are crucial for the survival of cancer cells can be attacked by small molecules such as protein tyrosine kinase inhibitors. An accompanying volume addresses the use of small molecules in oncology, and the two volumes together represent the third edition of the book originally published under the same title.
